ChatGPT said:

Thanks, I have the TMDB credentials.

The database is ready to use them, but I found that this processing environment cannot connect directly to TMDB's API. That prevents me from downloading the posters and descriptions here.

I can still prepare the complete enrichment process so it runs on your computer and updates the existing SQLite database automatically, without manually entering thousands of movies.

John's Movie Database — TMDB Enrichment Kit

ZIP · 723 KB · SQLite database + Python script + instructions

Download the enrichment kit ↗

The kit contains a Python script that uses your TMDB API key to retrieve posters, descriptions, runtimes and TMDB IDs, starting with the IMDb-matched films. It saves results directly into SQLite and can resume after interruption.

On Windows, extract the ZIP, open PowerShell in that folder and run:

```powershell
$env:TMDB_API_KEY = 'YOUR_API_KEY'
python enrich_johns_movies.py johns_movies_tmdb_ready.sqlite
```

Replace `YOUR_API_KEY` with the key you supplied.

Important: The downloaded database is not yet populated with TMDB images or descriptions. The script needs to run on a computer with internet access. The SQLite file itself has passed its integrity check.

TMDB supports looking up films by IMDb ID, which helps reduce incorrect matches.

The Movie Dat…

Once the script finishes, you'll have the enriched SQLite database ready for a movie browsing application.
